Servicing and maintenance

Whether you have a modern or older model Metro fire, maintaining it regularly to the manufacturer's instructions is important to maintain its safety, performance and longevity. Most wood burners and flue systems have parts that are designed to be replaced or cleaned periodically.

If a wood fire and its replacement parts are not regularly maintained and serviced as required, the life span of the appliance will be reduced.

A wood fire must be regularly maintained and an annual service is also recommended. Metro fires only feature minimal parts for servicing and these can be easily replaced by the homeowner. All replacement parts must be genuine authorised Metro parts only.

This Parts Guide details all the parts and product codes for the full range of current and superseded Metro fires.

Genuine Metro parts

We continue to manufacture and supply genuine Metro parts for every Metro fire ever manufactured and we guarantee this for 25 years from the last date of production for all models.

Installation and use of non-specific Metro parts may affect the tested safety clearances, alter the performance and will also void the appliance warranties.

Current models

Current models are detailed through pages 2-5 of this guide with thumbnails illustrated in colour including the years of release.

All current Metro fires feature a compliance label detailing the exact model name which is the most accurate way to determine the correct replacement parts required.

Superseded models

Superseded models are detailed through pages 6-9 of this guide with thumbnails illustrated in black and white including the years of release and manufacture.

All models feature a compliance label with model details which is the most accurate way to determine the correct replacement parts required.

Top baffle

The top baffle should be regularly checked and must always remain in place during operation of the fire.

The top baffle should be resting on four support lugs (two on each side of the firebox). It must be hard back against the rear wall of the firebox with the promet extension (white board) or return front steel edge of the baffle facing forward.

Some models feature a two piece top baffle that locks together using locating pins on the rear baffle.

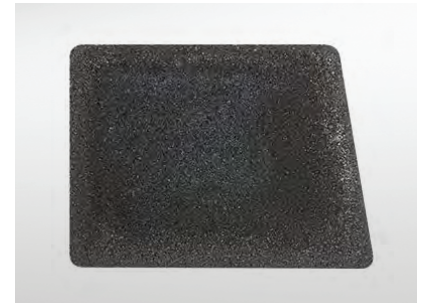

Promet extension

The promet is a sacrificial wear part of the top baffle and should be checked regularly.

Cracks in the promet have no adverse effect on the operation and performance of the fire. Cracks are the result of intense heat coupled with expansion and contraction and is normal wear and tear.

If the promet starts to break up and pieces fall into the firebox it must be replaced for safe and efficient operation.

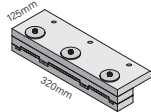

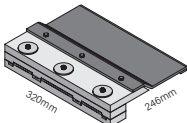

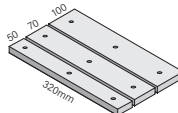

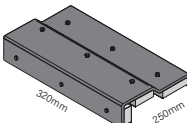

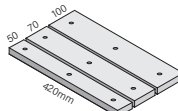

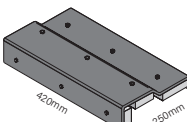

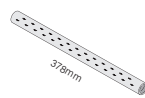

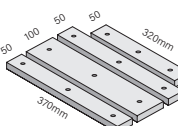

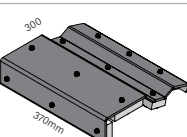

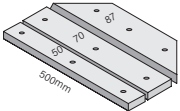

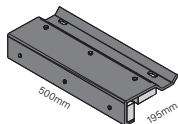

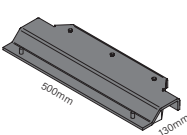

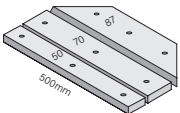

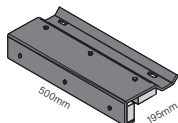

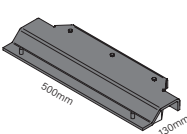

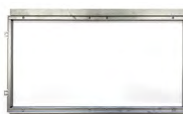

Fire bricks

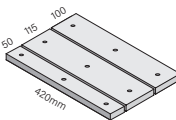

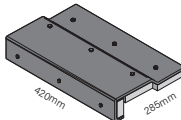

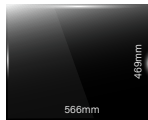

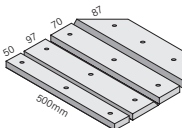

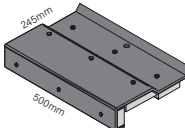

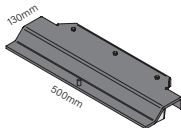

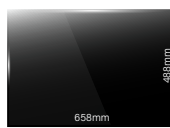

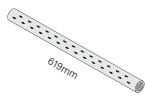

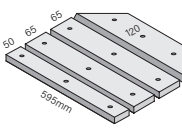

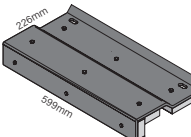

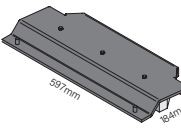

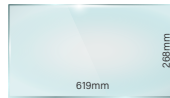

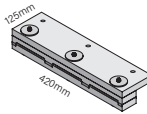

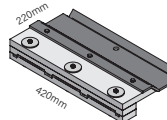

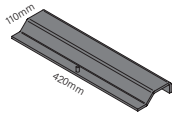

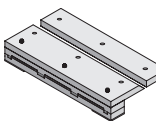

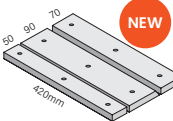

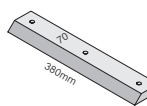

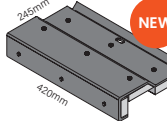

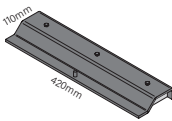

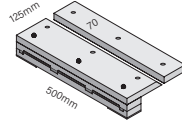

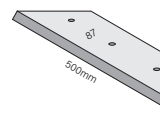

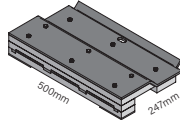

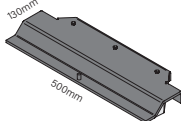

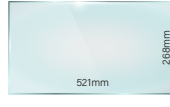

The Metro brick is common to current and superseded models to make part selection and replacement easy.

Some superseded models require a Metro brick at the back. There is a 'Z shaped' brick retainer clip on the rear wall of the firebox of these models.

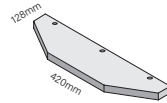

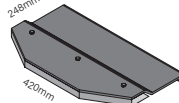

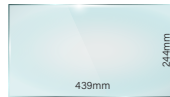

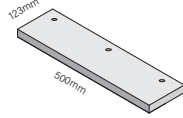

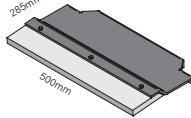

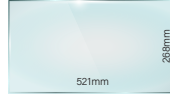

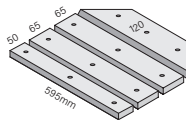

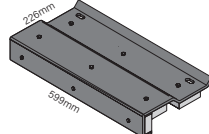

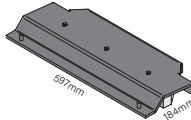

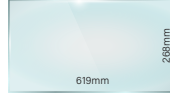

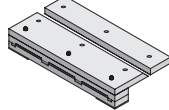

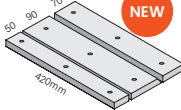

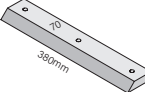

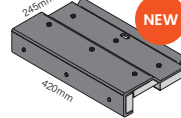

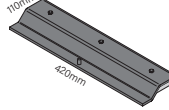

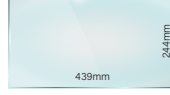

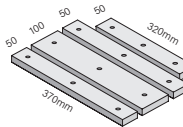

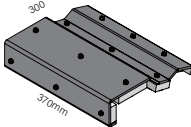

There are also some models that require their own unique fire brick set.

- Rad Plus and LTD Rad Plus models
- All Ultra low emission models
- Classic Rad model (superseded)
- Wee Rad V2 model (superseded)
